■ In Summary ................................................................................................................. 21
As Medicaid programs across the country face unprecedented change and financial uncertainty, demands on the Arkansas Medicaid program continue to grow. To meet this challenge, the Division of Medical Services (DMS) actively monitors the quality of care provided to beneficiaries through effective program management and an annual, comprehensive review of the Arkansas Medicaid program’s performance across key quality indicators.

**WHAT IS HEDIS?**
The Healthcare Effectiveness Data and Information Set, or HEDIS®, is a set of nationally recognized healthcare performance measures used to measure the quality of care and service delivery.

The HEDIS measure set consists of 76 measures across eight domains of care. These measures provide a standard way to compare performance across health plans and states.

**INTERPRETING THE RESULTS**
This report summarizes Arkansas Medicaid’s performance on a selected set of HEDIS measures. The current year’s rates are compared to the rates from previous years, and national NCQA Medicaid HEDIS benchmarks.

The national benchmarks are provided by NCQA and are updated annually using data submitted by Medicaid health plans across the country. Where applicable, results are provided for ConnectCare/ARKids First A and ARKids First B. Five-year trends are provided where available.

**LIMITATIONS**
SFY 2009 rates were calculated by HSAG; previous years’ rates were obtained from previous reports and are presented for trending purposes only.

The reader should exercise caution when comparing rates due to possible differences in calculation methodologies.

---

1 Healthcare Effectiveness Data and Information Set (HEDIS®) is a registered trademark of the National Committee for Quality Assurance (NCQA).
Pediatric primary healthcare involves disease prevention and the promotion of health for children and adolescents. Immunizations and health check-ups are particularly important for young children since failure to detect problems with growth, hearing, and vision may adversely affect children’s development and future experiences.

Early detection of disease conditions allows healthcare providers the best opportunity to detect issues and intervene. These services provide children with the opportunity to grow and learn without health-related limitations.

This section provides a detailed analysis of Arkansas Medicaid performance for the Pediatric Care dimension.

**STRATEGIES FOR IMPROVING PERFORMANCE**

- Provide notices to providers identifying patients due for immunizations and well-child visits
- Educate parents on well-child and immunization periodicity schedules
- Offer immunizations at health fairs, schools, and health clinics
- Offer incentives to providers and patients for routine exams and immunizations

**The Pediatric Care measures:**

- Well-Child Visits in the First 15 Months of Life (W15)
- Well-Child Visits in the Third, Fourth, Fifth, and Sixth Years of Life (W34)
- Adolescent Well-Care Visits (AWC)
- Childhood Immunization Status (CIS)
- Lead Screening in Children (LSC)
- Annual Dental Visits (ADV)
- Appropriate Treatment for Children with Upper Respiratory Infection (URI)
- Appropriate Testing for Children with Pharyngitis (CWP)
The American Medical Association (AMA) and the American Academy of Pediatrics (AAP) recommend timely, comprehensive well-child visits for children.

These periodic check-ups allow clinicians to assess a child’s physical, behavioral, and developmental status and provide any necessary treatment, intervention, or referral to a specialist.²

Researchers have found associations between increased well-child visits and reductions in avoidable hospitalizations and reductions in emergency department (ED) use, as well as improved child health.³

*There was a statistically significant change from the previous year’s rate.
The American Academy of Pediatrics recommends annual well-child visits for children between 3 and 6 years of age, provided that they are growing and developing normally and have no significant health problems.

Measure Definition

Percentage of members who turned three to six years of age during the measurement year and who received one or more well-child visits with a PCP.

Well-Child Visits — ConnectCare/ARKids First A

Well-Child Visits — ARKids First B

*There was a statistically significant change from the previous year’s rate.
Social experiences and changes in cognitive abilities lead many adolescents to experiment with activities that can threaten current health or have long-term health consequences.

More than 80 percent of adults who are addicted to tobacco began smoking as adolescents.

Adolescents who begin drinking alcohol before age 15 are four times as likely to be alcohol dependent as those who delay drinking until at least age 21.4

With regular well-care visits, a child’s healthcare provider can often detect and address health problems before they become more serious, and can educate adolescents on the importance of healthy behaviors.

*There was a statistically significant change from the previous year’s rate.

ConnectCare/ARKids First A
ARKids First B
NCQA Medicaid 50th Percentile

ARKANSAS
Despite established guidelines and the documented benefits and risks associated with childhood immunizations, a gap in coverage still exists. Evidence has shown that the population at greatest risk for under-immunization is minority children from low-income families or children who live in inner cities or rural areas.\(^5\)

The CIS measure was the only measure reported using the hybrid method. There is no SFY 2005 Combo 3 benchmark because Combo 3 was a new NCQA HEDIS measure and national data were not available.

Most dental problems do not become painful or visible until they are highly advanced.

Once a tooth becomes painful the dental damage is usually irreversible and frequently the tooth requires intervention such as: filling, root canal, crowning, or extraction.

By establishing good dental habits early in a person’s life, dental problems can be detected and treated.

**Annual Dental Visits (ADV) —**

**Measure Definition**

Percentage of members 2 to 21 years of age who had at least one dental visit during the measurement year.

**Annual Dental Visits – ConnectCare/ARKids First A**

*There was a statistically significant change from the previous year’s rate.
Appropriate Testing for Children with Pharyngitis (CWP) —

Measure Definition

The percentage of members 2 to 18 years of age who were diagnosed with pharyngitis, dispensed an antibiotic, and received a strep test for the episode during the measurement year.

Pharyngitis (i.e., sore throat) occurs most commonly in children between 5 and 18 years of age. Pharyngitis is caused primarily by one of two types of infections: 1) a viral upper respiratory tract infection or 2) a Group A streptococcus (strep) bacterial infection (i.e., strep throat). Determining the cause of pharyngitis is important since antibiotics are ineffective against viral infections, the cause for most episodes of pharyngitis.

However, in the Medicaid population, the average testing rate is only 61.4 percent compared to the commercial population rate of 75.6 percent. This measure identifies the percentage of children who were diagnosed with pharyngitis, dispensed an antibiotic, and received a Group A streptococcus (strep) test for the episode.

*There was a statistically significant change from the previous year’s rate.
Since the origin of most upper respiratory infections (URIs) is viral, the prescribing of antibiotics for the treatment of a majority of URIs is inappropriate. The use of antibiotics is only appropriate for a URI of bacterial origin. The use of antimicrobial drugs is highest among children; therefore, the pediatric age group is the initial focus of inappropriate antibiotic use. Excessive and frequent use of unnecessary antibiotics leads to increased incidence of allergic drug reactions with significant associated morbidity and mortality.

The Women’s Care dimension highlights measures designed to evaluate whether women 16 to 69 years of age are appropriately screened for cancer and sexually transmitted diseases (STDs), most of which are treatable if detected early.

The Women’s Care measures are only reported for the ConnectCare population. All of these rates were calculated using administrative data only.

**STRATEGIES FOR IMPROVING PERFORMANCE**

- Provide notices for providers identifying women due for preventive screenings
- Provide reminders to women to schedule their annual exams
- Offer women alternative screening sites such as mobile screening units
- Provide routine well-woman screenings during other office appointments
- Provide educational materials to physicians on effective strategies for communicating information to women on sex, STDs, and gynecological health

**The Women’s Care measures:**

- Breast Cancer Screening (BCS)
- Cervical Cancer Screening (CCS)
- Chlamydia Screening in Women (CHL)
A well-established method for preventing cervical cancer is the identification of pre-cancers before they become invasive. The Pap test is the most common way to screen for cervical pre-cancers and cancers.

Cervical Cancer Screening (CCS) —

**Measure Definition**

Percentage of women 21 through 64 years of age who received one or more Pap tests to screen for cervical cancer during the measurement year or two years prior.

*ConnectCare  
NCQA Medicaid 50th Percentile  
*There was a statistically significant change from the previous year’s rate.
Chlamydia is the most commonly reported STD in the United States; it infects approximately 2.3 million people between the ages of 14 and 39 years.13

Chlamydia is sometimes referred to as a “silent” disease, since approximately 75 percent of women with it exhibit no symptoms. As such, regular screening is critical to successful treatment.14

*There was a statistically significant change from the previous year’s rate.
Living With Illness

Chronic illnesses afflict 133 million people in the United States — nearly half of all Americans — and account for the majority of healthcare costs. By 2020, an estimated 157 million people will be diagnosed with a chronic illness.15

These illnesses are responsible for seven out of every ten deaths (or 1.7 million people) in the United States each year. Chronic illnesses also contribute to disabilities and decreased quality of life for many Americans. Additionally, more than 25 million people experience limitations in daily activities due to these conditions.16

STRATEGIES FOR IMPROVING PERFORMANCE

- Offer targeted case management programs to individuals that provide one-on-one education about their disease
- Provide incentives to members who receive recommended screenings
- Distribute educational newsletters to members and providers that contain disease-specific articles and updates
- Offer continuing education to providers on current clinical care and practice guidelines
- Distribute health status report cards to members that reinforce recommended screening requirements

The Living with Illness measures:

- Comprehensive Diabetes Care (CDC)
- Use of Appropriate Medications for People with Asthma (ASM)
According to the American Diabetes Association, effective care management to control the disease can help to reduce costs and prevent or reduce complications associated with the disease.\textsuperscript{17}

**Measure Definition**

HbA1c: The percentage of persons with diabetes (Type 1 and Type 2) 18-75 years of age who had one or more HbA1c tests during the measurement year.
Living With Illness

Comprehensive Diabetes Care (CDC) — continued

Measure Definition

LDL-C Screening: The percentage of persons 18–75 years of age with diabetes (Type 1 and Type 2) who had one or more LDL-C screenings during the measurement year

Eye Exam: The percentage of persons with diabetes (Type 1 and Type 2) 18–75 years of age who were screened for diabetic retinal disease during the measurement year

LDL-C Screening: Controlling lipid levels has been shown to reduce macrovascular complications, which affect the heart, brain, and legs (CDC, 2008).  

Eye Exam: Retinal examinations and timely treatment of conditions can reduce the development of vision loss, which is a complication often associated with diabetes.

Asthma is one of the most common diseases in the nation. It is estimated that 38.4 million people in the United States will have an asthma diagnosis in their lifetime, and 8.7 million of them are children. A lack of proper asthma management frequently results in hospitalizations, ED visits, and missed work and school days. Proper management of asthma can reduce ED visits and hospitalizations and increase work and school productivity.

Overall, performance during state fiscal year (SFY) 2009 continued to show improvement in both the ConnectCare/ARKids First A and ARKids First B populations; however, many of the rates continue to perform below the NCQA Medicaid 50th percentile.

**Pediatric Care**

- All well-child visit rates improved for both ARKids First A and ARKids First B members; however, performance remained below the NCQA 50th percentile.

- Childhood Immunization Rates (Combo 3) rates for ARKids First A and ARKids First B members improved from previous years. The ARKids First B rate exceeded the NCQA 50th percentile.

- The lead screening rates improved significantly from SFY 2008 to SFY 2009 for both populations, but remained below the NCQA 50th percentile.

- Dental visit rates continued to improve and ranked above the NCQA 50th percentile for both populations.

- The rates for appropriate testing for children with pharyngitis and treatment for respiratory infections were below the NCQA 50th percentile.

**Women’s Care**

- Breast cancer screening rates have been declining since SFY 2005. Over the last two years this rate has dropped 7.2 percentage points and is below the NCQA 50th percentile.

- The cervical cancer screening and chlamydia screening rates both showed statistically significant improvement in SFY 2009. Moreover, the chlamydia rate exceeded the NCQA 50th percentile.

**Living With Illness**

- Rates for the three diabetes measures declined in SFY 2009, and all of the rates performed below the NCQA Medicaid 50th percentile.

- Asthma rates for the ConnectCare/ARKids First A were similar to prior performance with the exception of the 18-50 year age group. This group’s rate dropped from SFY 2008 to SFY 2009.

  The Total rate for this population was less than 0.1 percentage point from the NCQA 50th percentile.

- The ARKids First B rates for asthma were also fairly stable with only a slight decline in the 5-9 year age group rate. The Total rate for this population exceeded the NCQA 50th percentile.
